

Automatically updating, dynamic process outlook

Ounet is a new kind of control and administration service for buildings automation on the Internet. It joins different age and different standard properties together to the same outlook – in a way appreciated by the user.

**Ounet saves time and money**

With Ounet you can monitor and control the automation in the property with ease, without actually visiting the site – in real time and effortlessly!

**For the existing and new Ouman devices**

Using this service requires that the property has Ouman automation and communication equipment as well as SMS, Ouman 3G interface or a public fixed IP address.

**Ounet is compatible with the following products: EH-200 series, EH-105, EH-686, EH-60, EH-net and Ouflex.**

**More information from your Ouman area representative or the Ouman sales group**

**Modern and developing administration tools**

Ounet has all the tools needed for the basic use of building automation. For example: by using clear graphic process images you can manage the timer controls and settings, and in fault finding situations the more advanced users can make use of the extensive events log as well as the administration of documentation and user notifications.

In Ounet the tools are scaled according to the users, you get just the tools you need!

**The more, the better!**

The benefits provided by Ounet are best highlighted in the coalition of large numbers of properties and several different users. At an annual level this means enormous savings in resources and expenses. Of course connecting a single property to Ounet also reduces extra work!

Ounet scales itself into large masses of users and properties.

Automation control and administration service

## Flexible control of property masses!

Ounet has a clear and flexible three-tier administration mechanism, where **Users** (people), **Accounts** (companies) and **Targets** (properties) are established as their own entities.

Users and properties are joined together via the accounts, at the same time determining the required user rights.

This type of administration mechanism also enables the changing of user rights or users easily in accordance with the changing contract patterns of the company, for example.

At the same time all users and companies (those registered with Ounet) connected to the property maintenance can be viewed in the property information. That's practical!

## Special know-how for effective use!

To adjust the heating, plumbing, ventilation and electrical installation processes of the properties into an energy-efficient and secure level requires special know-how, which cannot always be found in the company or only in limited capacity.

With Ounet this special know-how is utilised effectively by using user rights to distribute demanding tasks only to certain personnel and the basic usage for a wider amount of personnel.

Ounet also enables the visiting users to be connected with the target, thus making it easy to temporarily use external experts as well.

## Ounet connects the properties and the users

With Ounet the users can control either single properties or larger property entities. The administration rights are determined at different user rights levels. For example, on level 1 the user can change setting values, determine controls, remove or add users etc. Respectively, on level 5 the user can only read different measurement values or other general information.

User levels:

- 1
- 2
- 3
- 4
- 5
